SIX DELIVERIES

## DRAWING FRAME

THE object in view in designing this Drawing Frame has been to build a strong, rigid frame without undue weight, which at the same time will be simple in construction, combined with accessibility of all its parts, and designed to meet thoroughly the exacting conditions in the cotton mill which a Drawing Frame must meet.

Particular attention is called to the fact that this Drawing Frame is so constructed that any part can be removed from the machine without disturbing adjacent parts or adjustments. Also, the middle sumpson is so designed that it does not interfere with the cans at the back in any way. The back, front, and full can stop motions are positive and simple in their action.

FRAMING AND CONSTRUCTION. The framing of the machine is of unique construction, being made entirely of steel, patents of which are pending, which makes it extremely strong and rigid without the aid of cross bars or diagonals. Can tables are set on top of floor.

BOTTOM FLUTED ROLLS are made in one length and are irregularly fluted to prevent cutting of top rolls. The usual diameters are  $1\frac{1}{4}$  inches or  $1\frac{3}{8}$  inches front,  $1\frac{1}{8}$  inches or 1 inch second, third and back lines.

WOONSOCKET MACHINE  
AND PRESS COMPANY

FRONT VIEW—SIX DELIVERIES

## DRAWING FRAME

**T**OP ROLLS are usually one inch in diameter on the iron. The four lines have loose ends. We furnish either our ball-bearing, leather-covered, or metallic rolls, as desired.

CALENDER ROLLS are made of steel, turned, ground, polished, and are so arranged that each section can be taken out individually without disturbing any other section.

ROLLER STANDS have composition blocks in them for roller bearings, and are made with separate adjustable bearings so constructed that the top and bottom rolls move together when setting for different lengths of staple.

DRAFT GEARING. All draft and roller gears are cut. Draft changes are very easily made, it being necessary to change only one gear to alter the draft. The gearing is well protected with polished covers.

COILERS are made for cans, 36 inches long, 10 or 12 inches diameter, as required.

TRUMPETS. These are made separate from the calender roll plates, and can be taken out and replaced when worn.

BACK SLIVER GUIDES. These are so made as to separate the slivers and stop kinks from entering the rolls. Uneven work is thus prevented.

WOONSOCKET MACHINE  
AND PRESS COMPANY

REAR VIEW—SIX DELIVERIES

## DRAWING FRAME

**TENSION.** A close adjustment can be made for either ordinary or metallic rolls by means of our fine pitch gearing for the take-up of the sliver between the front rolls and calender rolls, thus reducing the breakage, sagging, and stretching of the sliver and preventing stoppages and waste.

**CLEARERS.** Both top and bottom rolls have clearers. Calender roll clearers and covers can be taken out for cleaning and the like, without breaking the sliver between calender rolls.

**WEIGHT-RELIEVING MOTION.** This is applied to all frames for taking the pressure off the rolls when frames are stopped. All rolls are weighted separately. The usual weights are 20 pounds front line, 18 pounds second line, 16 pounds third line, and 14 pounds back line.

**TRAVERSE MOTION** is positive, and each part can be taken out without disturbing the adjustment of any other part, and is applied to all frames with leather-covered top rolls.

**DRIVING PULLEY AND SPEED.** The driving pulley on the bottom shaft is usually 16 inches diameter, 3 inch face, and can be placed at either end of the frame. The usual speed of this shaft is 250 r.p.m., which gives a calculated speed of 363 r.p.m. of front roll. Ratio of front roll to bottom shaft is 1.45.

- U Intermediate Gear to second Roll, 30 teeth.
- W Second Roll Gear, 40 teeth for  $1\frac{1}{4}$ -inch Front Roll; 37 teeth for  $1\frac{3}{8}$ -inch Front Roll.

## Drawing Frame Calculations

### DRAFT CALCULATIONS

Rule:—

$$\frac{A \times C \times K \times M \times D \times \text{Dia. of Calender Roll}}{B \times L \times N \times P \times \text{Dia. of Preventer Roll}} = \text{Draft Constant}$$

Example:—

Common Roll. Back Roll Gear (C) = 48 teeth  
Calender Roll Gear (P) = 76 teeth

$$\frac{18 \times 48 \times 108 \times 20 \times 104 \times 3}{48 \times 29 \times 65 \times 76 \times 11 \frac{1}{8}} = 200.71$$

Rule:—

$$\frac{\text{Draft Constant}}{\text{Draft Change Gear}} = \text{Draft}$$

Example:—

Draft Change Gear (J) = 67 teeth

$$\frac{200.71}{67} = 3.00 \text{ Draft}$$

Rule:—

$$\frac{\text{Draft Constant}}{\text{Draft}} = \text{Draft Change Gear}$$

Example:—

Draft = 3.52

$$\frac{200.71}{3.52} = 57 \text{ Draft Change Gear}$$

### PRODUCTION CALCULATION

Rule:

$$\frac{\text{R.P.M. of Front Roll} \times M \times O \times \text{Circumference of Calender Roll} \times \text{Wt. of Sliver in Grains} \times 600 \text{ (Min. in 10 hours)} \times .80 \text{ (Allowing 20\% for stoppages)}}{N \times P \times 7000 \text{ (Grains in 1 lb.)} \times 36 \text{ (Inches in 1 yd.)}} = \text{Lbs. in 10 hours}$$

Example:—

R.P.M. Front Roll = 390

Circumference Calender Roll = 9.4248

Wt. Sliver in Grains = 59

$$\frac{390 \times 20 \times 104 \times 9.4248 \times 59 \times 600 \times .80}{65 \times 76 \times 7000 \times 36} = 113$$

### FLOOR SPACE

To find total length of frame in inches for any number of heads:

(Total number of deliveries x 16) plus (Number of heads x 23 1/2) equals total length in inches

Example:—

Number deliveries in head = 6

Number heads = 2

$$(12 \times 16) + (2 \times 23 \frac{1}{2}) + 7 \frac{1}{2} = 246 \frac{1}{2} \text{ inches or } 20' 6 \frac{1}{2}''$$
